

Map interpretation note

This map was developed specifically for the Wetland Vision Technical Document

Freshwater resources on the coast

This maps shows the Wetland Visions future potential map overlain by some information that shows pressures impacting on the coast, and areas that would once have been naturally saline. Where these areas coincide, freshwater habitat delivery may prove unsustainable, or otherwise result in habitat more naturally responsive, with a mix of freshwater and brackish habitats. The full effects cannot be accounted for within the projects aspirations, and will be locally determined according to the outputs from shoreline management plans (SMPs) and coastal habitat management plans (CHaMPs). Data are derived from the outputs of Futurecoast project and an extraction on Environment Agency Flood Map (2001).
